

BABY SUPPORT WRAP

Abstract

5 A baby support system directed to providing improved support for a baby,
particularly for its head and back, while being held and carried. The baby support
system includes two support structures. The first support structure is adjacent to the
10 second support structure which is made of a flexible, resilient, material which at least
partially conforms to the baby's body, providing support for the baby. The second
support structure is positioned on the first support structure such that when the first
support structure is wrapped about the baby it maintains the second support structure in
a desired position with respect to the baby, thereby providing the desired support for the
baby.
